

## ACKNOWLEDGMENTS

I would like to express my appreciation to the many people in my life who have inspired, guided and supported me. This list starts with my high-school physics teacher, Valeria Tikhomirova. Thanks to her, I began to enjoy physics and learned to appreciate the quality of teaching. She is the reason I have become a teacher.

Professor Philip Sadler has been my mentor for the last four years. He has been an immense influence on me as a researcher and a teacher, and I am deeply grateful to him for everything. This section cannot possibly be long enough to list everything I owe to Professor Sadler. He encouraged me to enter HGSE, taught me throughout these years and spent an enormous amount of time helping me design, implement, and present the results of this project. His support has been unwavering, and his patience – limitless.

This project would not have been possible to complete without the direct help of many other individuals. I am grateful to the CyberTutor group at MIT, led by Professor David Pritchard. The entire experimental part of the study was based on the Internet-based platform developed under his guidance. All members of the group went out of their way in assisting me. David Kokorowski, Sofia Morote and Adam Morton worked with me directly; without their continuous support, this study could not have been completed.

The project involved more than a hundred high-school students who became willing participants and spent a lot of time solving physics problems for me. I cannot name them all but I would like to acknowledge their teachers who spent even more time than their students to help me collect the data and complete the project. They are: Julie Crockett,

Jim Currie, John Engstrom, Brian Finn, Gardner Friedlander, Eric Kemer, Ira Nirenberg, Phil Wallin, and Helen Young.

Several of my friends donated their time discussing the project with me; these discussions have broadened my understanding and helped interpret the data and formulate the conclusions. Many thanks to Nina Arshavsky, Genya Shteingold and Leonid Mirny. I am also thankful to David Perkins and Terry Tivnan, the faculty members at HGSE: discussions with them helped shape up the proposal and made the data analysis stronger. That the final manuscript looks more or less decent is thanks to the thoughtful comments and corrections by Prof. Judah Schwartz and Prof. Irwin Shapiro; along with Prof. Sadler, they formed an incredibly supportive, well-communicating Committee of Readers. I am especially grateful to Prof. Shapiro, who also took it upon himself to edit the imperfections of my English (except for this section, which, I am sure, shows).

The last three years of my life have been quite strenuous, and I would not have survived this experience without the warm and collegial atmosphere that I have enjoyed at work: the administration and the colleagues at Weston Public Schools have been just wonderful. My sincere thanks to Alan Oliff, Richard Houde, Richard Desimone, Philip Lanoue, Gita Foster and all my colleagues at the Science Department, especially Tim Reed and Jim Currie. I am fortunate to have been a part of this team of educators.

Last but not least, I would like to express my deepest appreciation to my wife, Alla, whose support, smile and inspiration have made it all possible.

Any omissions, ambiguities, errors and other shortcomings that remain in this manuscript – despite the efforts of all people named above – are my fault entirely.
